

# On the way to more robot transparency

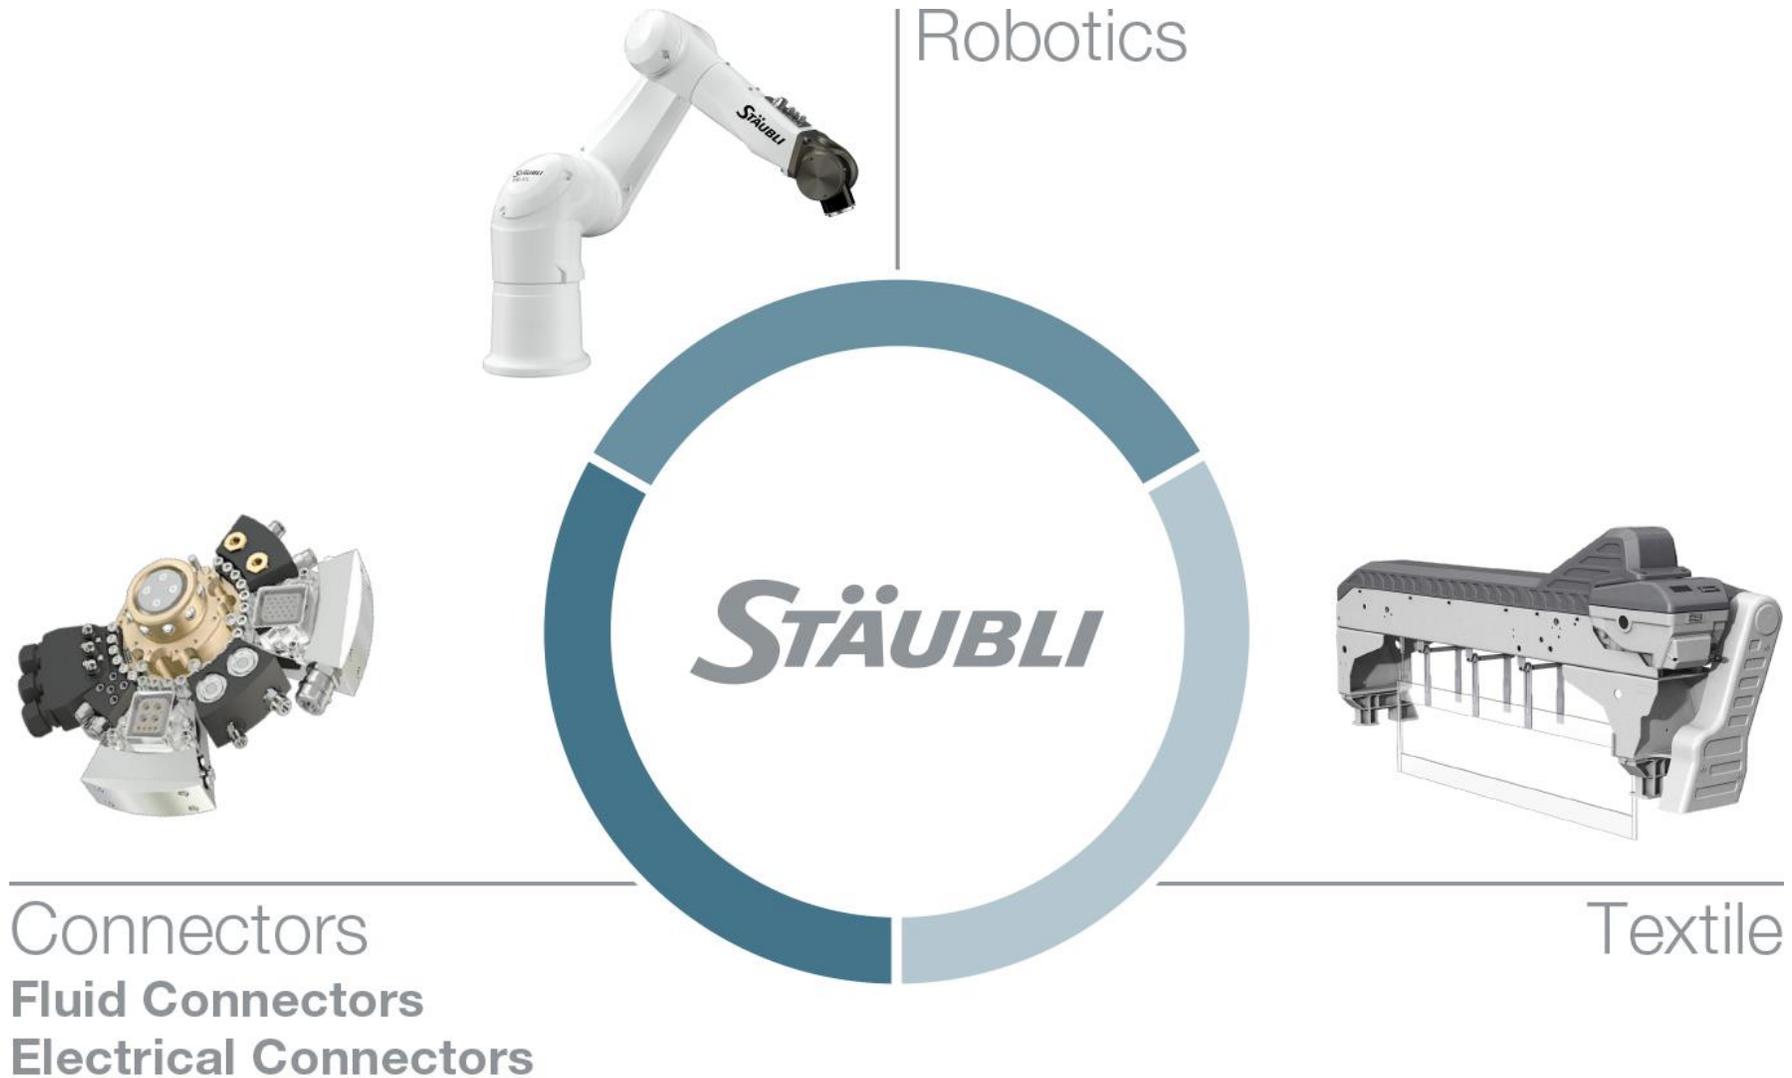

10. Robotics Kongress | 10.02.2021 | Günter Heinendirk

# Global presence of the Stäubli Group

# Three activities – four divisions

# High performance and reliability

Our Textile products and services range from

- **Automated weaving preparation systems,**
- **Shedding solutions for frame weaving and Jacquard weaving to**
- **Carpet weaving systems,**
- **Weaving systems for technical fabrics,**
- **Automation solutions for sock knitting machines**

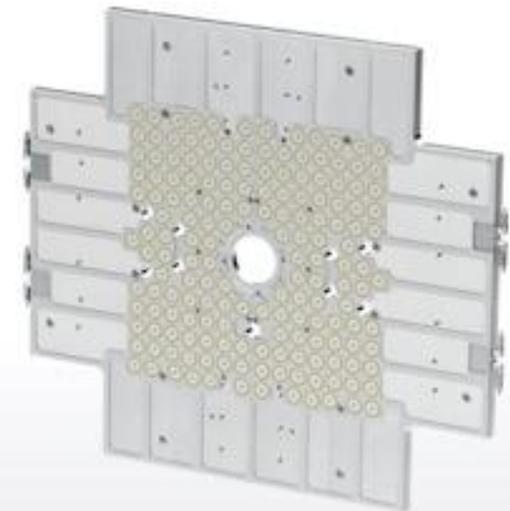

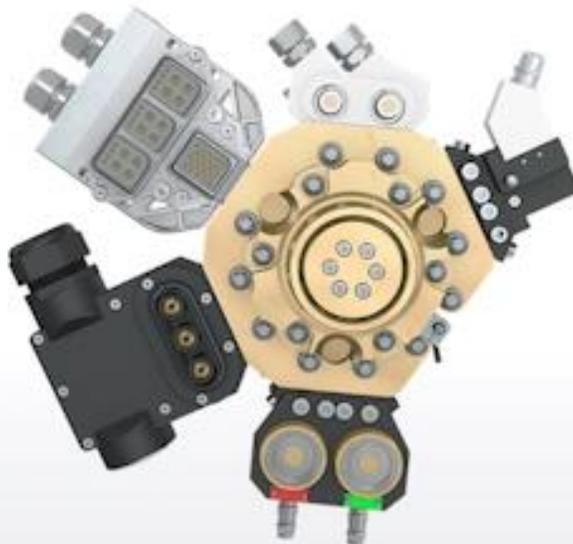

as well as **spare parts** and **customer training**.

# Reliability at every connection, versatility for every application

## Stäubli Fluid Connectors product range covers:

- Quick-release couplings
- Energy centralized connections
- Robotic tool changers
- Quick mold change solutions for the plastics industry including :
  - mold clamping solutions
  - tool loading tables and trolleys
- Our solutions are designed to ensure cost efficiency and operators' safety.

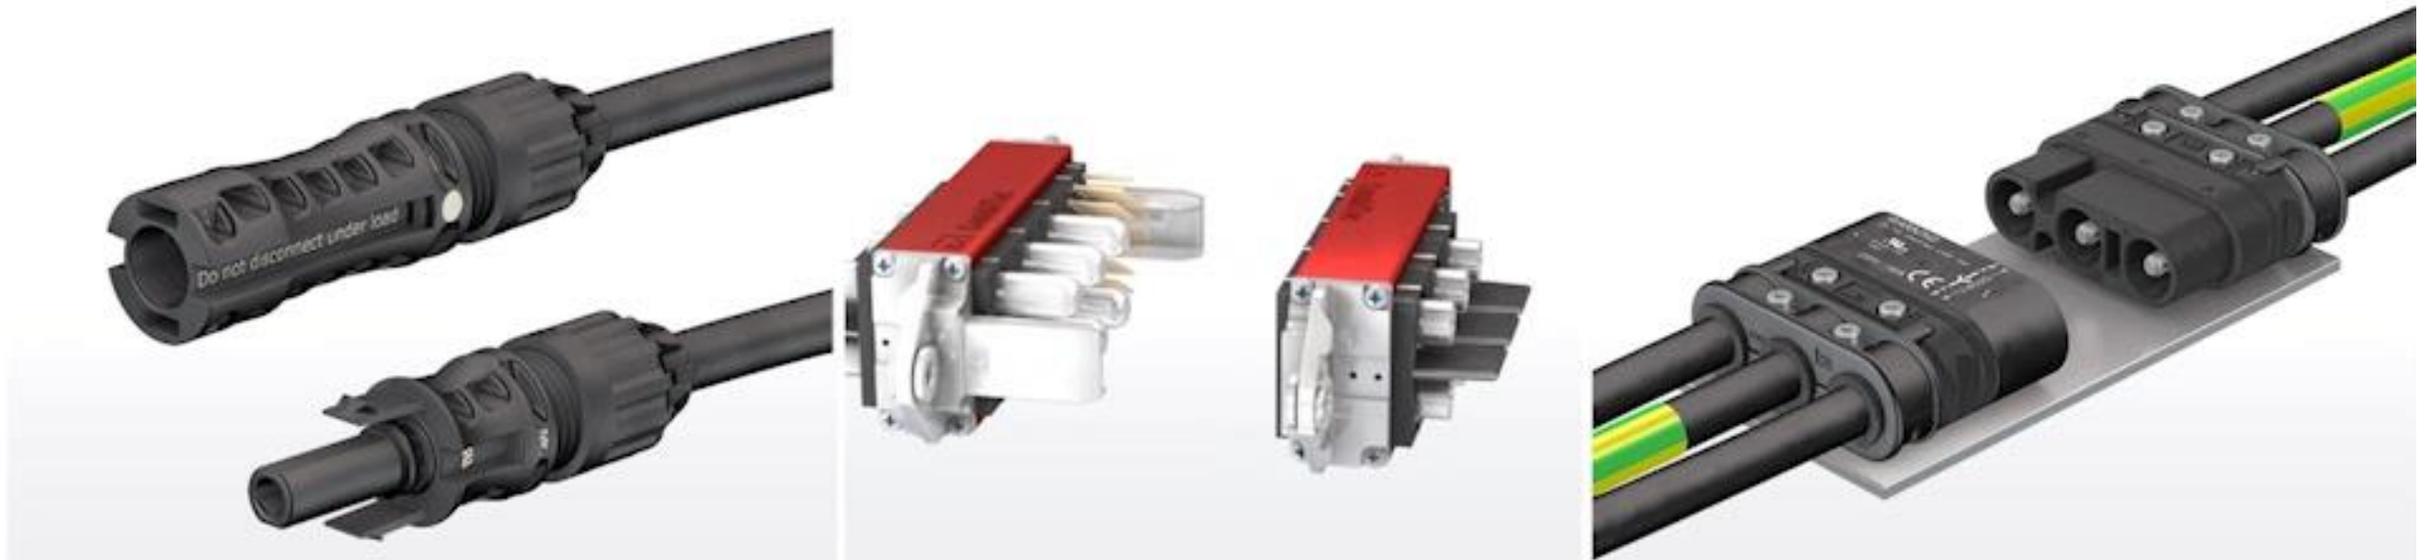

## ELECTRICAL CONNECTORS

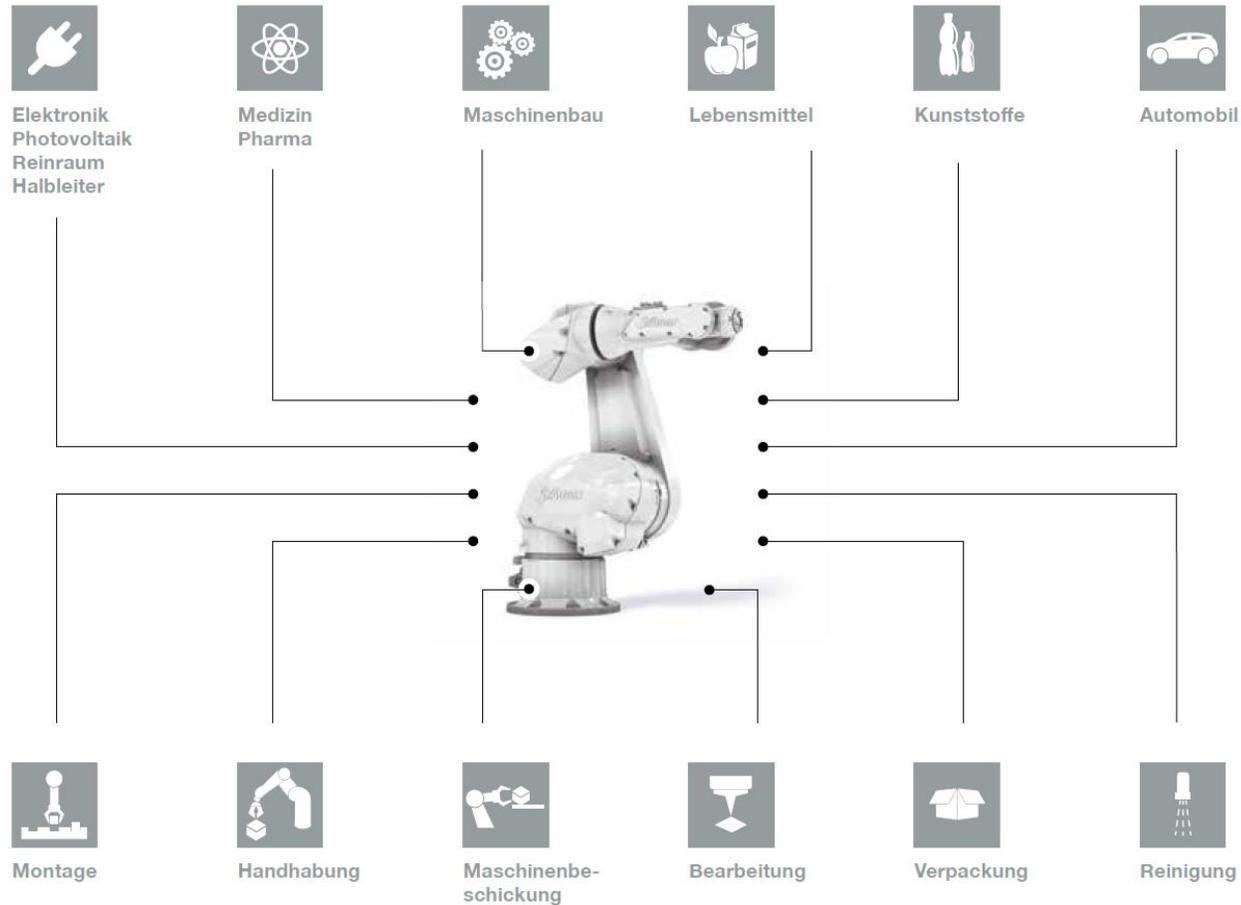

## Solutions tailored to each industry

Stäubli Electrical Connectors cover the whole range from single parts to highly complex systems

- MULTILAM contact technology
- designed for reliability and long service life
- outstanding electrical and mechanical properties
- fit for harsh environments
- to transmit power, data, signal and fluids

**Stäubli-Robots** guarantee high process reliability and productivity gains in all industries and application areas:

# Business Models

## For our customers

- Evaluation of the robot status (lifetime)
- Reduction of downtime
- Indicators for quality of own products
- Maintenance and exchange parts on demand
- New pay per XXX models
- Cycle time optimization

## For Stäubli

- Obtaining information on operating conditions for R&D
- Quality control
- Improved service deployment planning
- Better adapted warranty conditions
- New pay per XXX models

**WHO ARE THE STAKEHOLDER?**

# Which group in the company is involved?

**At customer side**

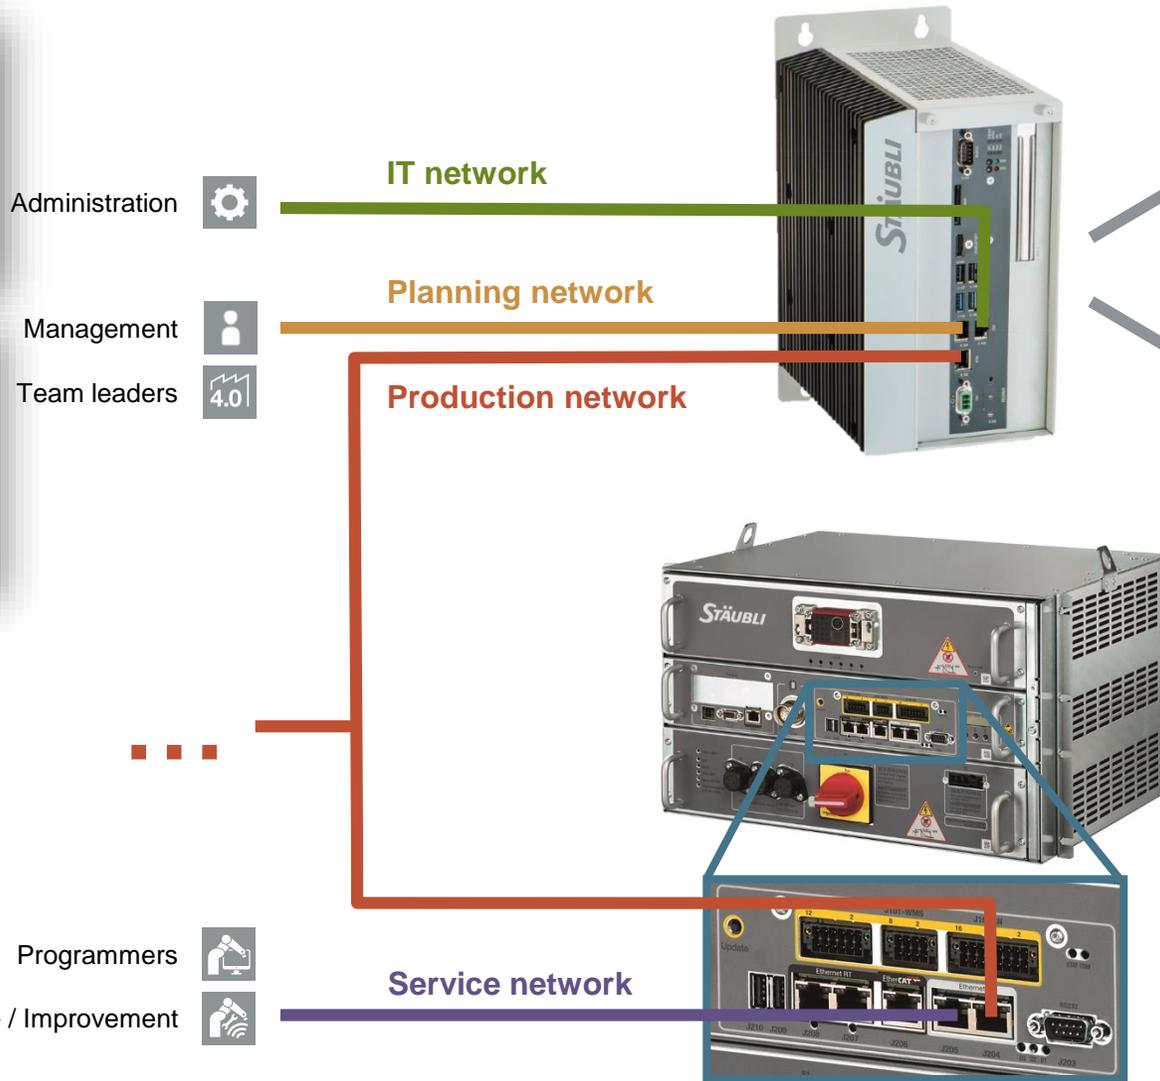

- Maintenance
- Production planning
- Quality department
- Purchasing department
- IT

**At Stäubli**

- Sales
- Service
- Quality department
- R&D
- Support

# WHO ARE THE STAKEHOLDER? Infrastructure

The image shows three screenshots of Stäubli software. The top one is a system status page with various metrics and graphs. The middle one is a management dashboard with icons for different robot models. The bottom one is a detailed view of a robotic arm with technical specifications and a timeline.

- Administration
- Management
- Team leaders

- Programmers
- Maintenance / Improvement

Big / Live Data Customer

Big / Live Data Stäubli

# The 5 W's

**W**hich data?

**W**hy do we do this?

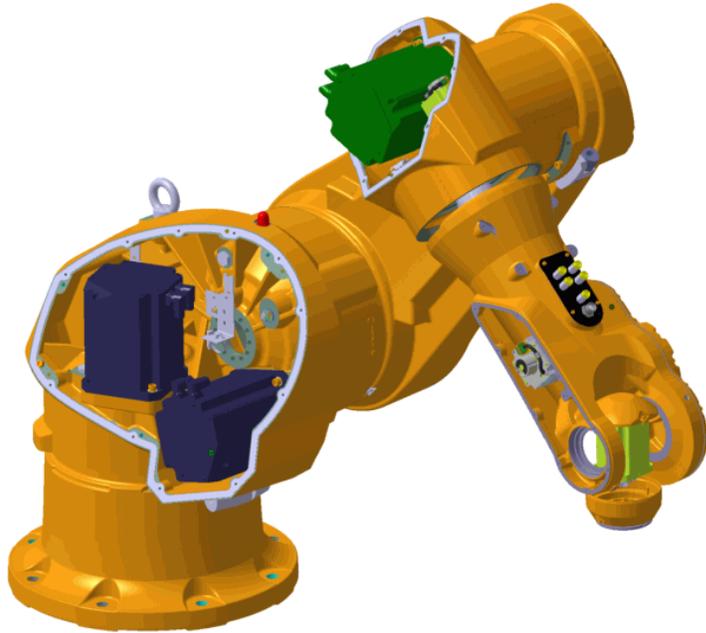

**W**here to store?

**W**ho are the Stakeholder?

**W**hat to do with it (how to evaluate)?

# Which data is interesting?

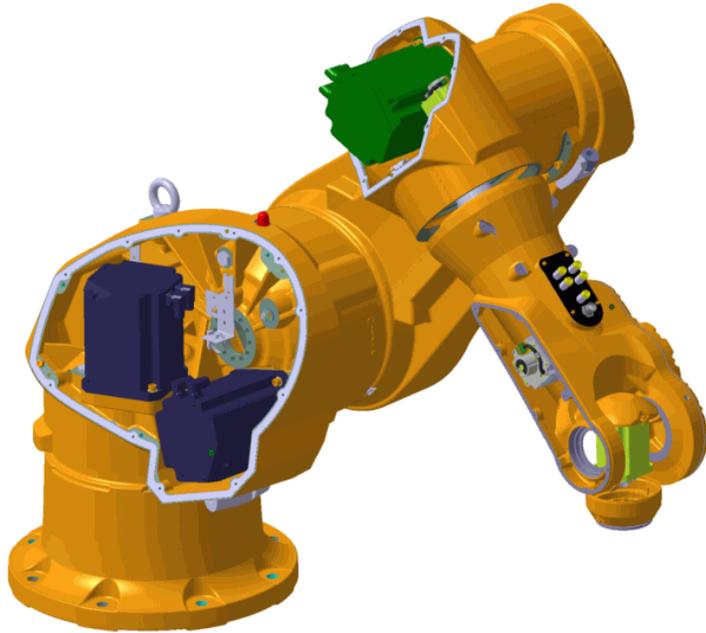

- Serial numbers of all components
- Payload of the robot
- Operating hours of the arm
- Commanded and actual positions of the joints
- Commanded and actual currents of the joints

- Serial numbers of all components
- Operating hours of the controller
- Software Versions (operating system, tuning)
- Temperature (amplifier, CPU, controller)
- Log files
- Application specific information
- Inputs and outputs

# Quantity of data

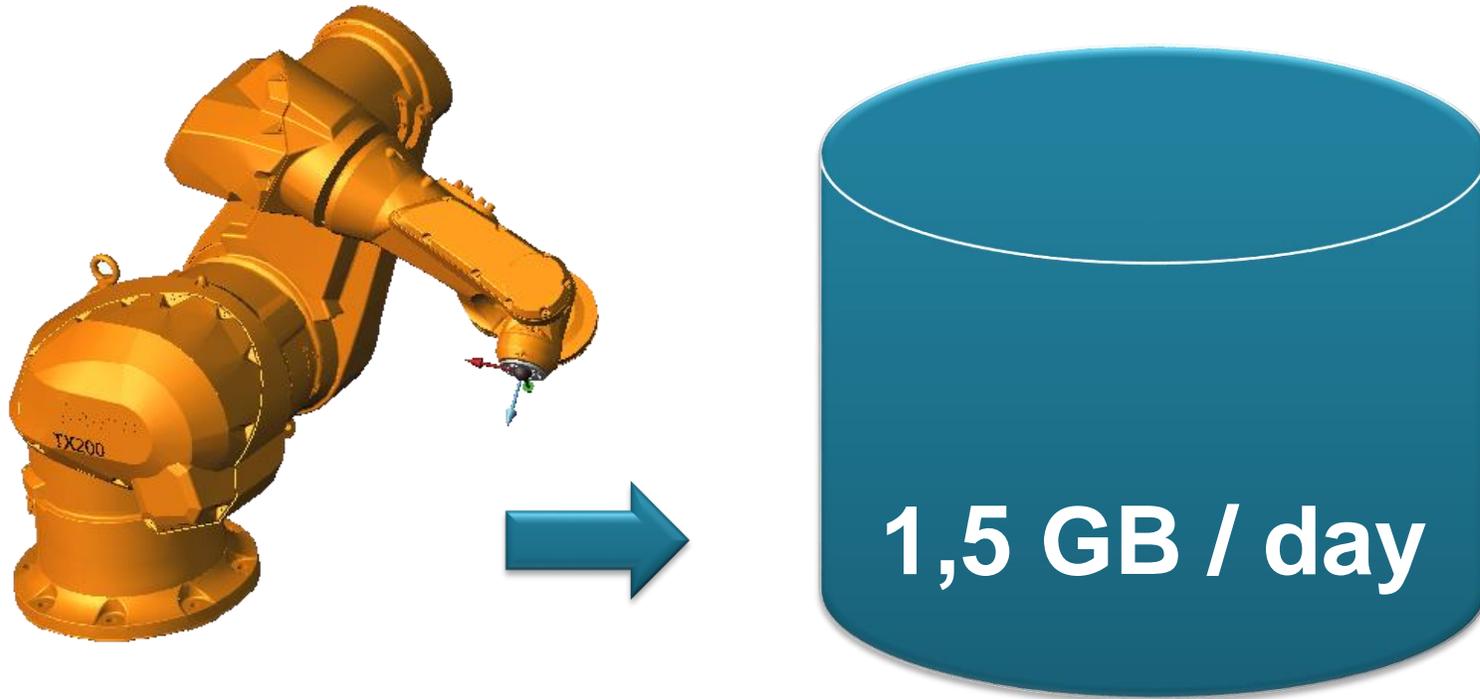

- ✗ Serial numbers of all components
- ✗ Payload of the robot
- ✗ Operating hours of the arm
- ✓ Commanded and actual positions of the joints
- ✓ Commanded and actual currents of the joints

- ✗ Serial numbers of all components
- ✗ Operating hours of the controller
- ✗ Software Versions (operating system, tuning)
- ✗ Temperature (amplifier, CPU, controller)
- ✗ Log files
- ✗ Application specific information
- ✓ Inputs and outputs

WHERE TO STORE?

Edge or Cloud ?

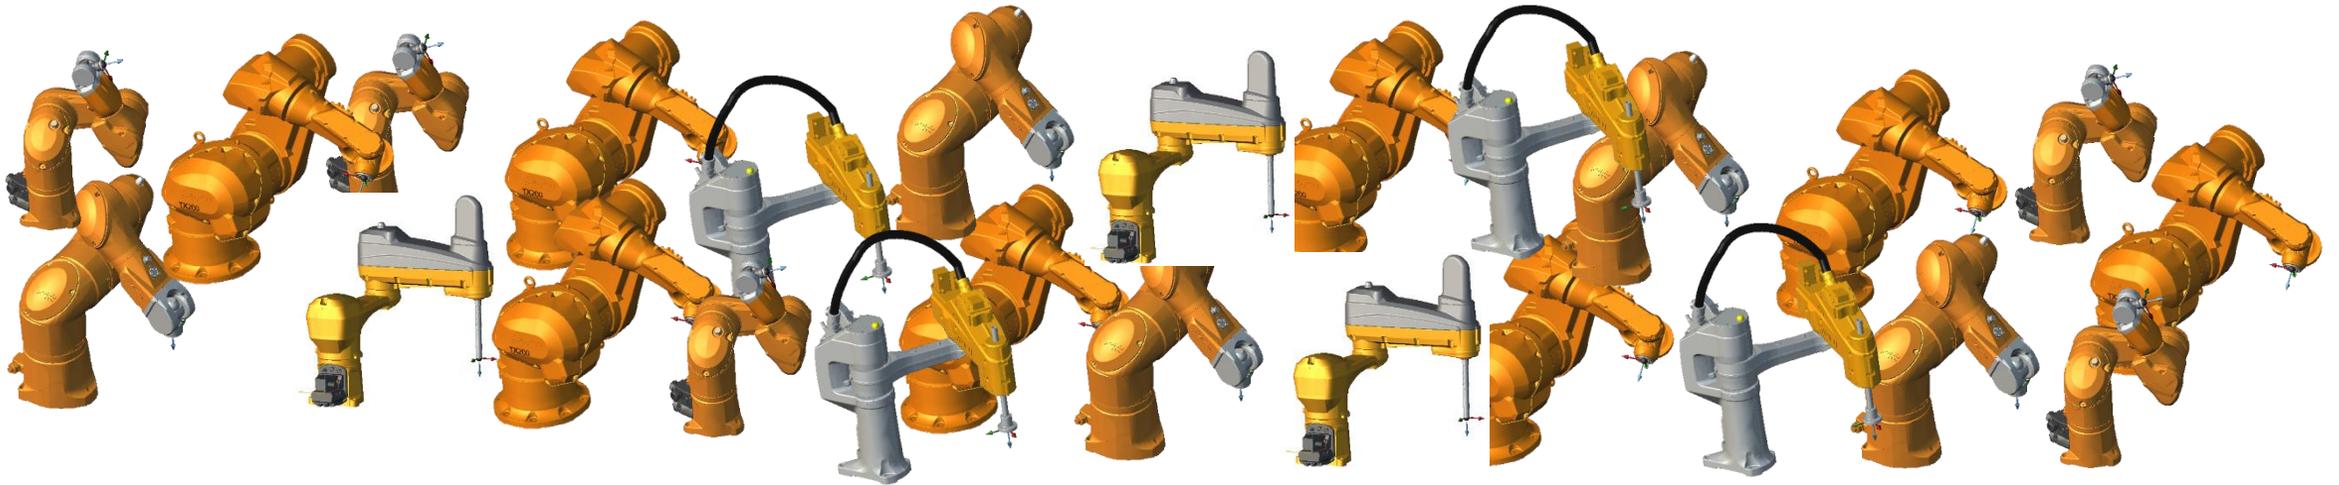

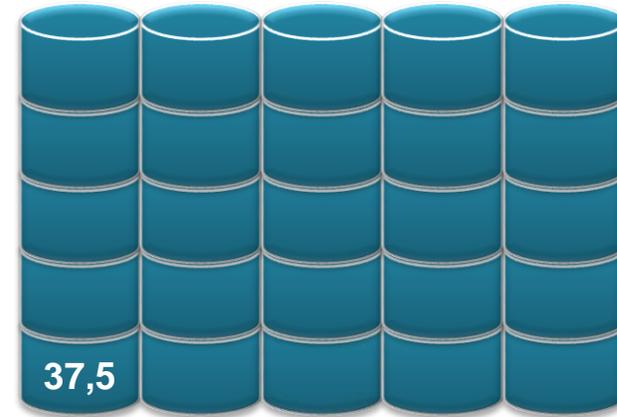

WHERE TO STORE?

Edge or Cloud ?

STÄUBLI

**37,5 GB / day  
with 25 robots**

# The 5 W's

**W**hich data?

**W**hy do we do this?

**W**here to store?

**W**ho are the Stakeholder?

**W**hat to do with it (how to evaluate)?

## HOW TO EVALUATE?

## Data reduction

- 37.5 GB per day cannot be written to the cloud via the Internet connection
  - For the first evaluation **Edge** is the right place
  - Data reduction
    - Data storage in the Edge **costs „little“ money**
    - Data must be grouped in **same trajectories** and **examined separately**
    - **Gradual** changes of a trajectory can be easily determined via average values per time unit
    - **Raw data** of a trajectory of a time interval (e.g. 1 hour) **should be kept** if the average value per time interval changes
    - Raw data of a trajectory must be kept if the average value differs **significantly** from others in the same time period
    - Remaining raw data will be deleted after 24 hours
- 2 GB of data per robot on Edge Server**

## HOW TO EVALUATE?

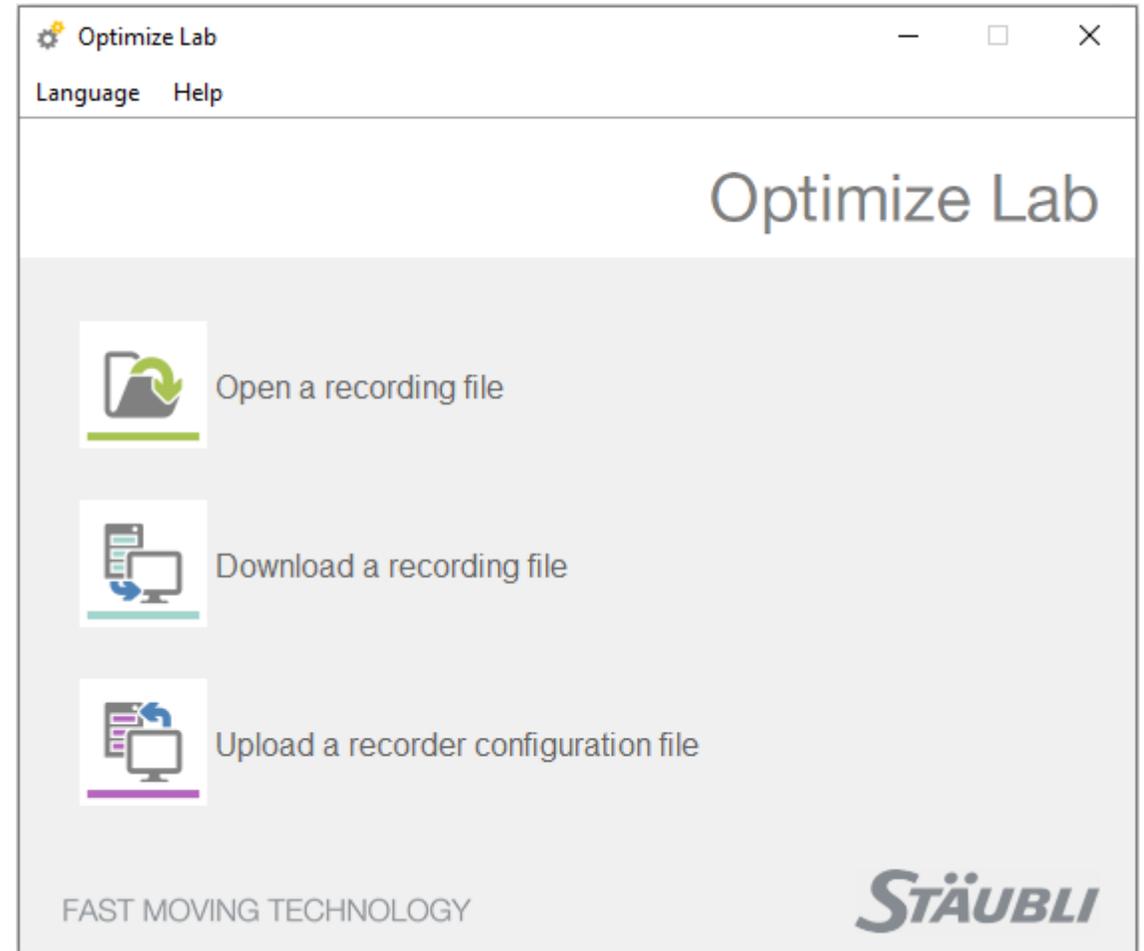

## Edge or Cloud?

- 37.5 GB per day cannot be written to the cloud via the Internet connection
  - For the first evaluation **Edge** is the right place
  - Data reduction
    - Data storage in the Edge **costs „little“ money**
    - Data must be grouped in **same trajectories** and **examined separately**
    - **Gradual** changes of a trajectory can be easily determined via average values per time unit
    - **Raw data** of a trajectory of a time interval (e.g. 1 hour) **should be kept** if the average value per time interval changes
    - Raw data of a trajectory must be kept if the average value differs **significantly** from others in the same time period
    - Remaining raw data will be deleted after 24 hours
      - **2 GB of data per robot on Edge Server**
      - **70 MB / robot / day to the cloud**
- ➔ **Edge and Cloud !!!**

## HOW TO EVALUATE?

## OptimizeLab

- Software for the analysis or evaluation of recordings
- Determines the current load on the robot based on the recorded data
- Provides valuable information that can be used to optimize a motion sequence
- Calculates an expected lifetime for each axis

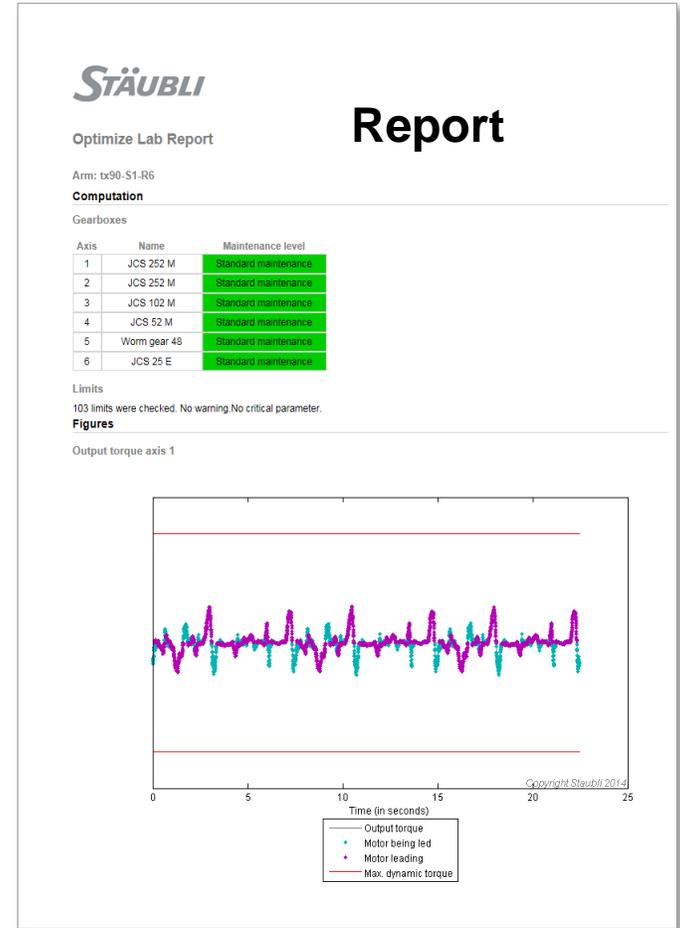

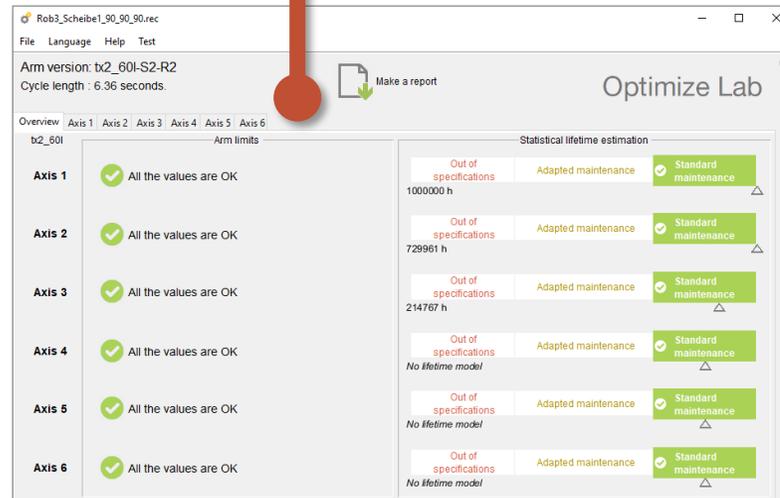

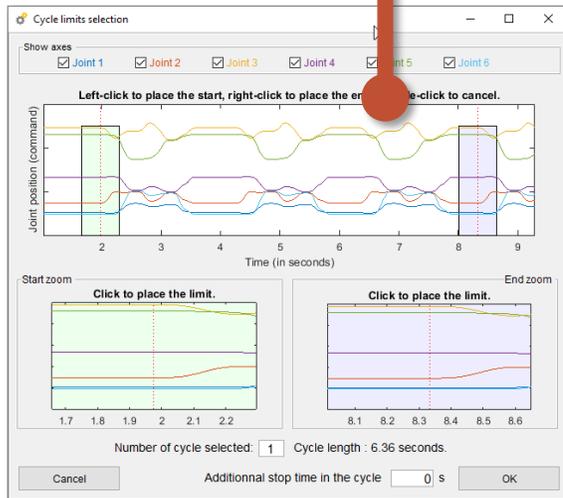

# OptimizeLab – How is my robot doing?

- Verification?
- Documentation?
- Warranty?
- Consequences?
- Downtime?

# HOW TO EVALUATE?

# OptimizeLab – How is my robot doing?

## HOW TO EVALUATE?

## OptimizeLab – Monitoring

**Regular analyses help to detect an overload of the robot at an early stage.**

Reasons for this can be:

- Poorly taught positions
- Changes to the tool
- Changes in the process
- Changed dynamics
- Backlash
- Mechanical defects

**Optimize Lab enables the documentation of the current state**

These reports can be used for:

- The proof to the customer on acceptance of the machine  
(„ The robot is operating within its specifications“)
- As an incoming inspection of the customer when taking over the machine
- As proof in case of damage  
(„ The parameters were changed after taking over of the machine“)

# HOW TO EVALUATE?

**STÄUBLI**

### Optimize Lab Report

Arm: tx90-S1-R6

**Computation**

Gearboxes

Axis	Name	Maintenance level
1	JCS 252 M	Standard maintenance
2	JCS 252 M	Standard maintenance
3	JCS 102 M	Standard maintenance
4	JCS 52 M	Standard maintenance
5	Worm gear 48	Standard maintenance
6	JCS 25 E	Standard maintenance

Limits  
103 limits were checked. No warning.No critical parameter.

**Recording**

File name	OptimizeLab_d.rec
Arm	tx90-S1-R6
Controller	F12_5K7NA1_C_01
Val3	s7.7.2
Configuration	c1.028
Origin	drive
Frequency	250 Hz
Length	7500 samples

**Cycle limits selection**

Show axes  
 Joint 1  Joint 2  Joint 3  Joint 4  Joint 5  Joint 6

Left-click to place the start, right-click to place the end. Double-click to cancel.

Start zoom **Click to place the limit.** End zoom **Click to place the limit.**

Number of cycle selected:  Cycle length : 6.36 seconds.

Cancel Additional stop time in the cycle  s OK

# OptimizeLab – Cycle time optimization

## Evaluation of the Recordings

Check the potential

Which joint is the most stressed?

The screenshot shows the OptimizeLab software interface. The window title is 'OptimizeLab\_d+OptimizeLab\_c'. The menu bar includes 'Datei', 'Sprache', and 'Hilfe'. The main content area is divided into several sections:

- Left sidebar:** Contains buttons for 'Übersicht', 'Achse 1', 'Achse 2', 'Achse 3', 'Achse 4', 'Achse 5', and 'Achse 6'. A red arrow points to the 'Achse 3' button.
- Top center:** Displays 'Armversion: tx90-S1-R6' and 'Zykluslänge: 7.49 Sekunden'. A 'Bericht erstellen' button is located to the right.
- Middle section:** Titled 'Grenzwerte des Roboterarms', it shows six rows, each with a green checkmark and the text 'Alle Werte sind OK'.
- Right section:** Titled 'Statistische Lebensdauer', it displays a table with three columns: 'Außerhalb der Spezifikation' (red), 'Angepasste Wartung' (yellow), and 'Standard Wartung' (green). The third row is highlighted with a red border.

Achse	Spezifikation	Angepasste Wartung	Standard Wartung
Achse 1	Außerhalb der Spezifikation	Angepasste Wartung	Standard Wartung
Achse 2	Außerhalb der Spezifikation	Angepasste Wartung	Standard Wartung
Achse 3	Außerhalb der Spezifikation	Angepasste Wartung	Standard Wartung
Achse 4	Außerhalb der Spezifikation	Angepasste Wartung	Standard Wartung
Achse 5	Außerhalb der Spezifikation	Angepasste Wartung	Standard Wartung
Achse 6	Außerhalb der Spezifikation	Angepasste Wartung	Standard Wartung

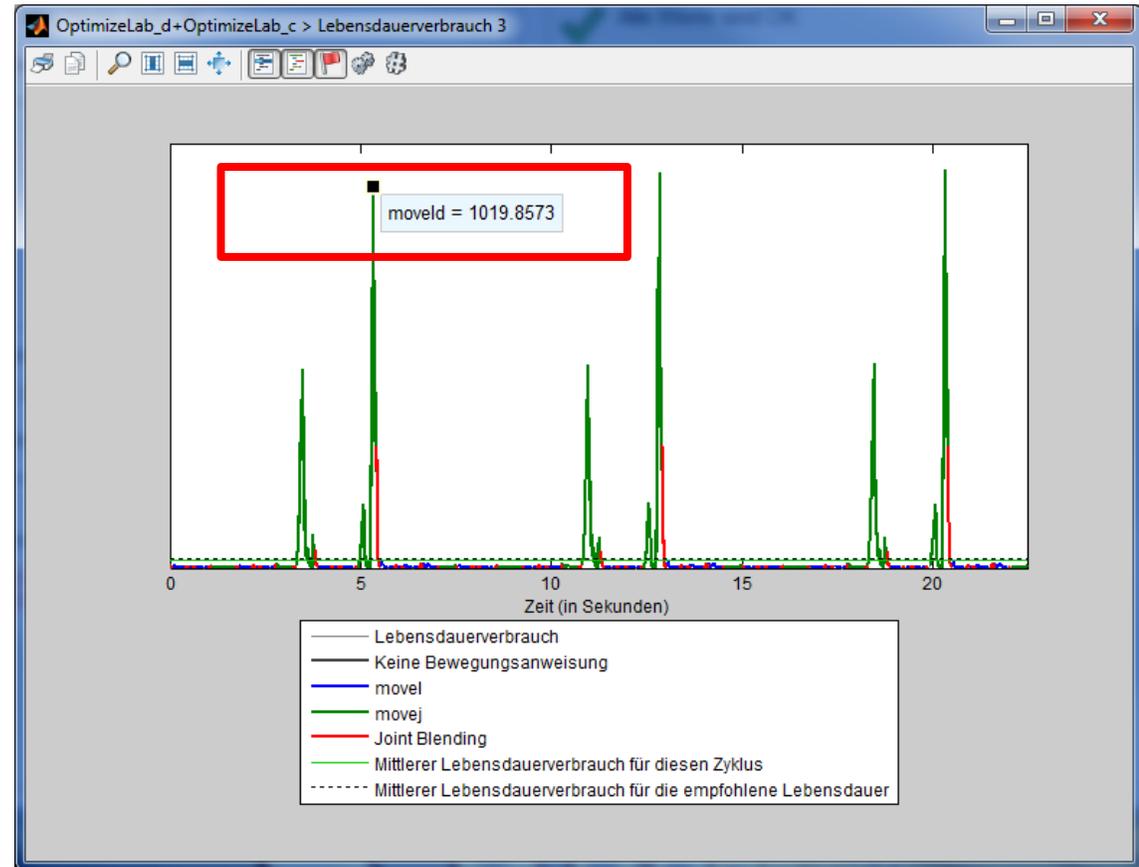

# OptimizeLab – Cycle time optimization

## Evaluation of the Recordings

Check the potential

Which joint is the most stressed?

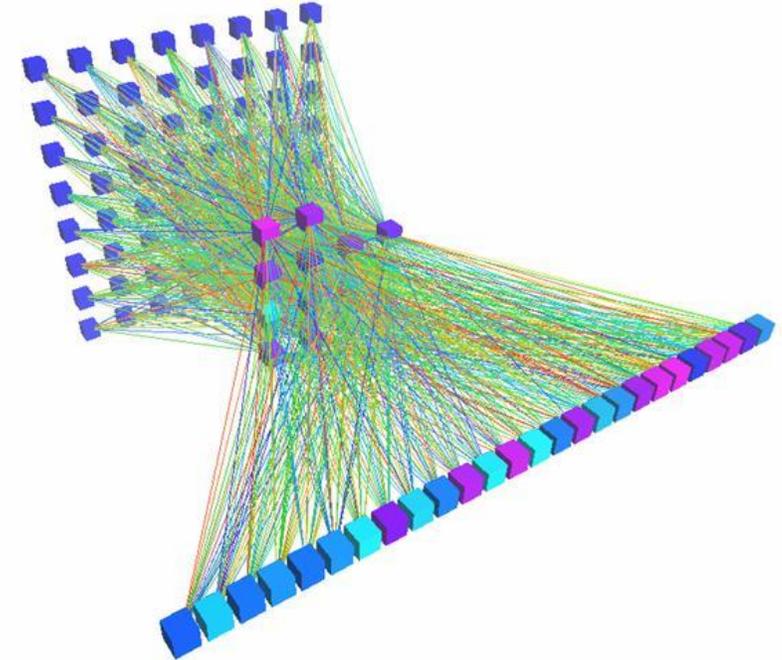

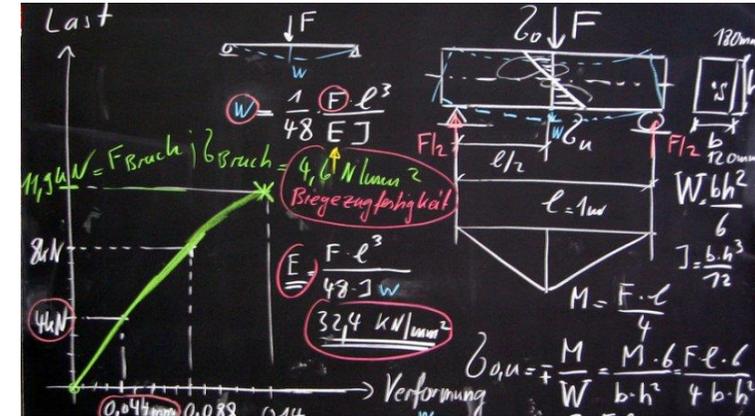

Detect stress peaks in the application.

## HOW TO EVALUATE?

# Mathematical methods

- “Classical” mathematics offers valuable methods to generate knowledge from data.
- In combination with physical laws, this approach is definitely not “old style”.
- OptimizeLab shows that very good results are achieved
- A neural network needs a lot of input data and a lot of training to get to the level of OptimizeLab.
- The “new” mathematics with many new approaches to pattern recognition is not a panacea but a perfect complement to the “classical” mathematics.
- The combination of both methods can do much more than the individual methods alone, especially for complex mechanical systems.

# Summary

- The coordination of many different stakeholders in "Big Data" requires many discussions and persuasion efforts
- New business models can generate added value in many places - for all parties involved
- Big Data as a "quantity" is often underestimated
  - common mistakes are sorting out information too early due to capacity concerns (Network, Storage, CPU, ...)
  - Meaningful data reduction is one of the most important tasks
- Combining "old" knowledge (e.g. physics, chemistry, mathematics, understanding of the production / product) with "new" mathematics often leads to better results
- Already trained neural networks can achieve good results in similar problems with much less data and time
- The goal today is not BigData but SmartData
- ... and tomorrow not SmartData but „Knowledge“
