

The background is a dark gray gradient. On the left, there is a large, stylized wireframe head in profile, facing right. The head is composed of many interconnected lines forming a mesh. Some of the vertices of the mesh are highlighted with small, bright white star-like glows. To the right of the head, there is a complex network of white lines and shapes, resembling a circuit board or a data flow diagram. This network includes various symbols such as gears, arrows, and interconnected nodes, suggesting a technical or digital theme. The overall aesthetic is futuristic and high-tech.

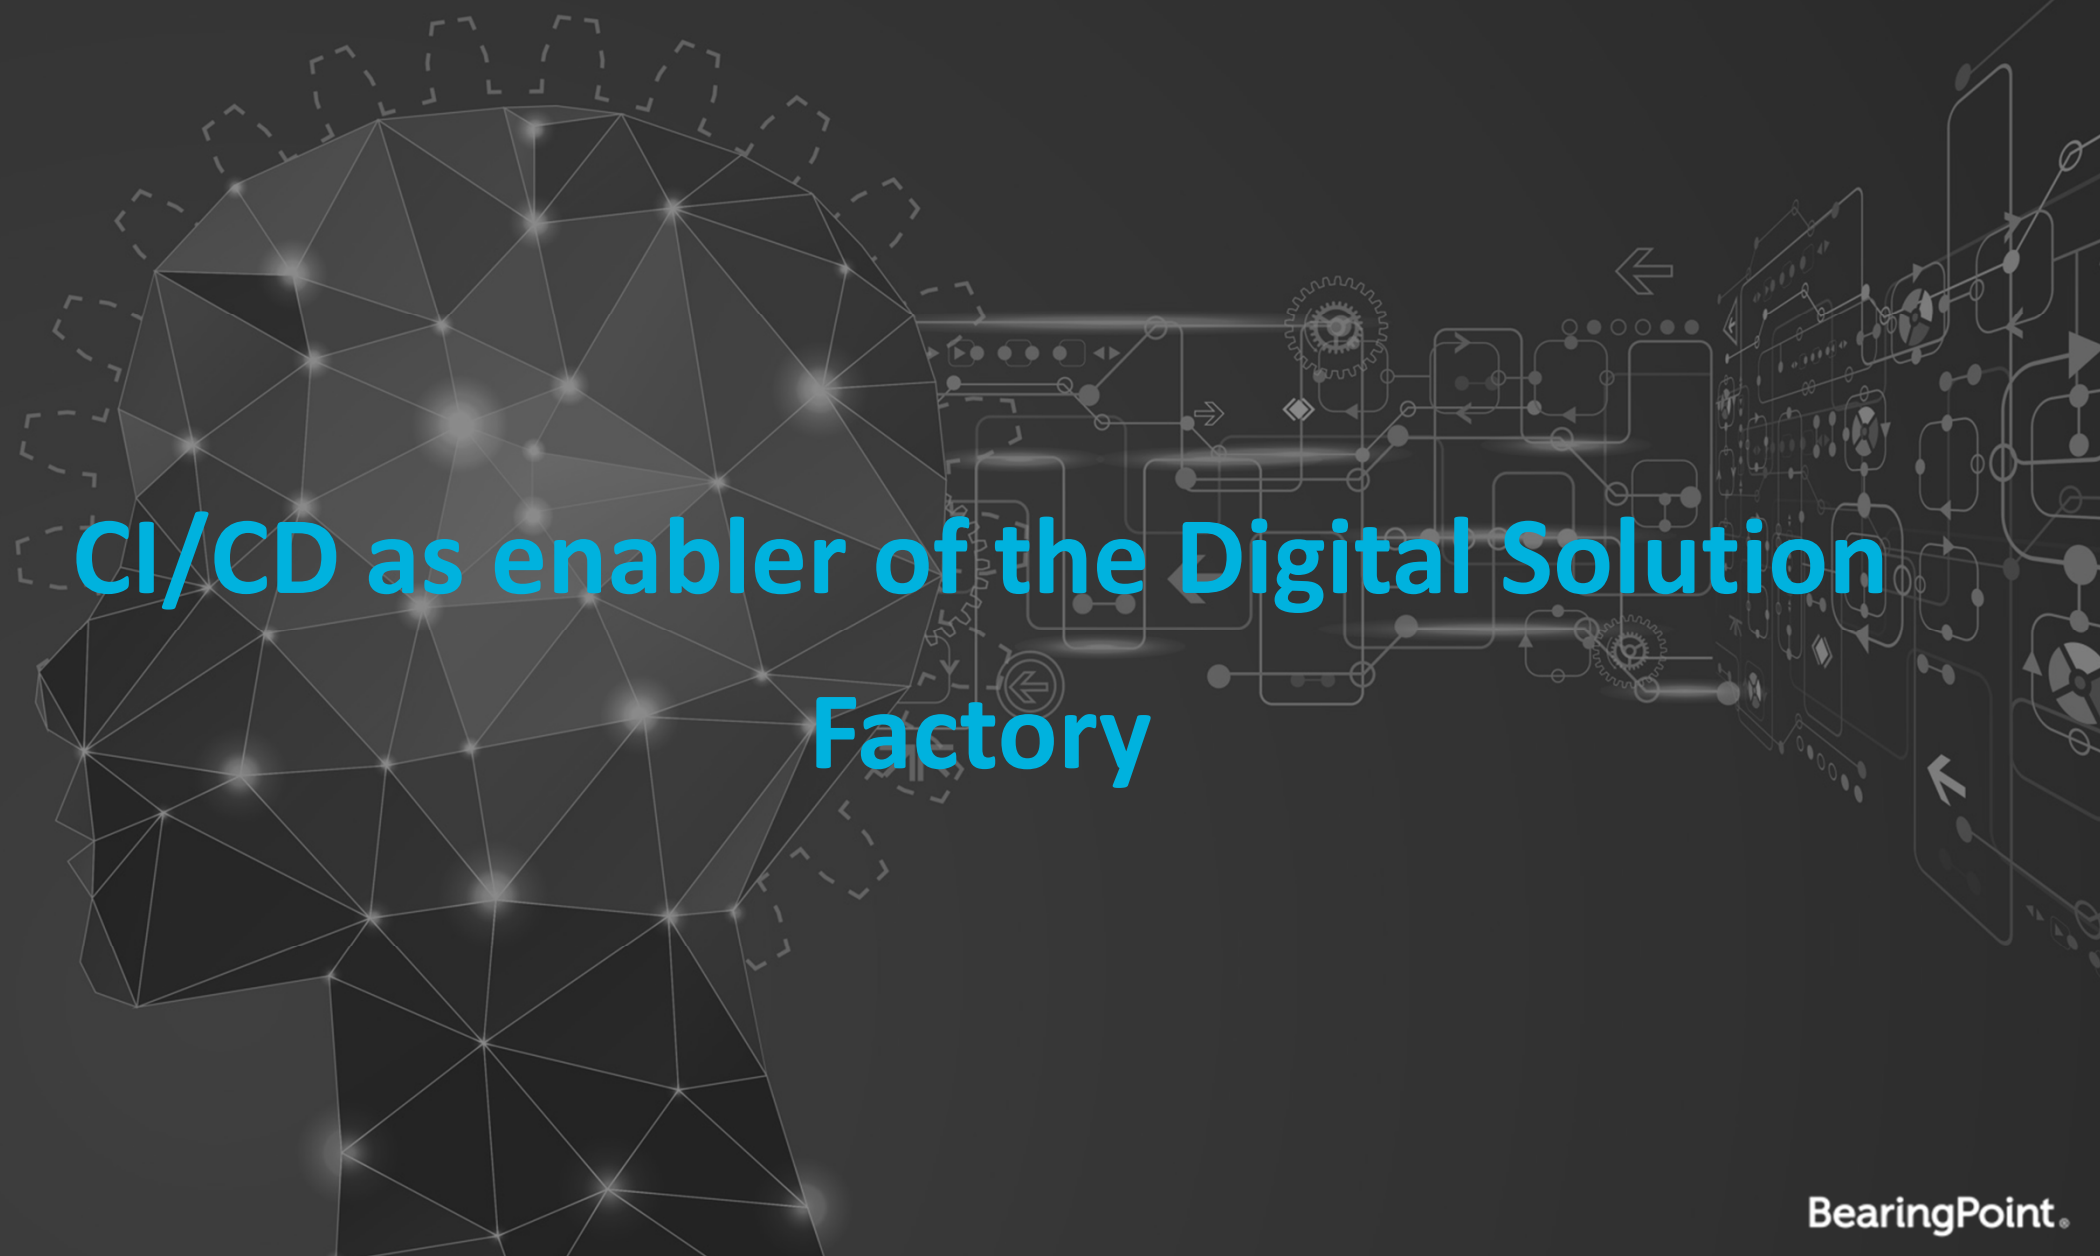

# Complex Solution Development in the Cloud

How SAP BTP supports implementation and operations of individual custom developments

# Complex Solution Development in the Cloud

- 1 CI/CD as enabler of the Digital Solution Factory
- 2 Current Capabilities of the SAP BTP

- 4 Lessons Learned while establishing our Digital Solution Factory
- 5 Q&A

# CI/CD as enabler of the Digital Solution Factory

# Modern Software Development Concepts

Key aspects to consider for modern software development processes

## Agile

focuses on  
**processes**

highlighting **change**

while accelerating  
**delivery**

## CI/CD

focuses on **software-**  
**defined life cycles**

highlighting **tools**

that emphasize  
**automation**

## DevOps

focuses on  
**culture**

highlighting **roles**

that emphasize  
**responsiveness**

# Status Quo

## How development is done today

Changing  
Business  
Needs

Absence of  
continuous  
Feedback

- Non standard development processes
- Non standard requirements engineering
- Individual operations processes
- Inventing the same thing twice
- Inconsistent user experience
- Issues in handover to operations
- Rampup and ramp down costs for development
- Many repositories

Disconnected  
Teams

- Missing continuous improvement processes
- Technological debts
- Security risks
- Cluster risks of know how accumulation
- Dependency on 3rd party suppliers
- Inconsistent integration scenarios
- Inconsistent data models
- Heterogeneous technology stacks
- Know how transfer between business and dev, dev and operations

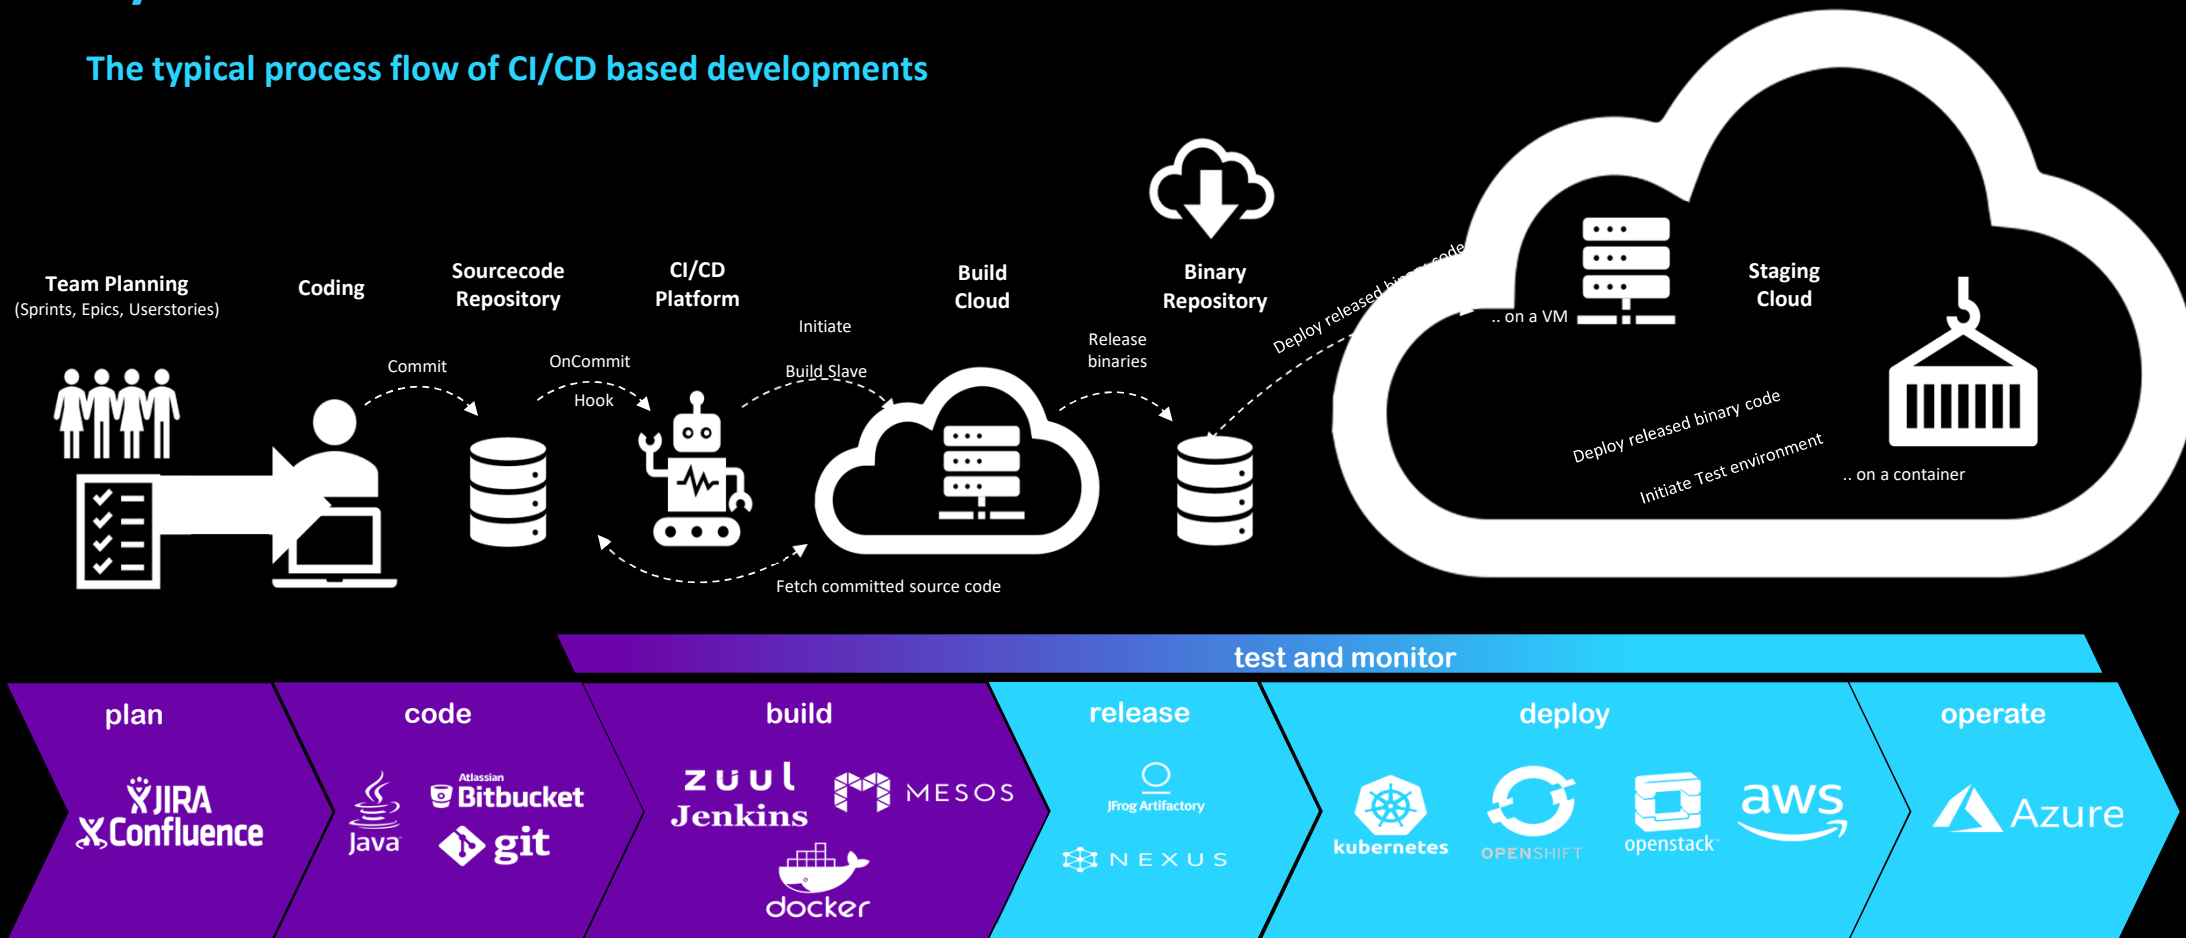

High Costs

Time  
Constraints

# CI/CD in a nutshell

The typical process flow of CI/CD based developments

## Digital Solution Factory

A digital Solution Factory provides business capabilities at a fraction of individual software development and operations cost

- Accommodate your individual business needs beyond out of the box solutions from major providers
- Innovative approach to a business problem or to gain competitive advantage faster
- Proven components tailored for your enterprises specific needs and knowledge
- Integrate directly in your system landscape instead of a loosely coupled solution from a third party

- Need of process add-ons or new process extensions that are not supported out of the box of your software providers
- Business requirements have changed and need an enhancement that is not supported directly by existing systems
- You want to reduce implementation and operations cost of your individual software
- Need an immediate solution to be directly integrated into your core systems

[Review Contents](#)

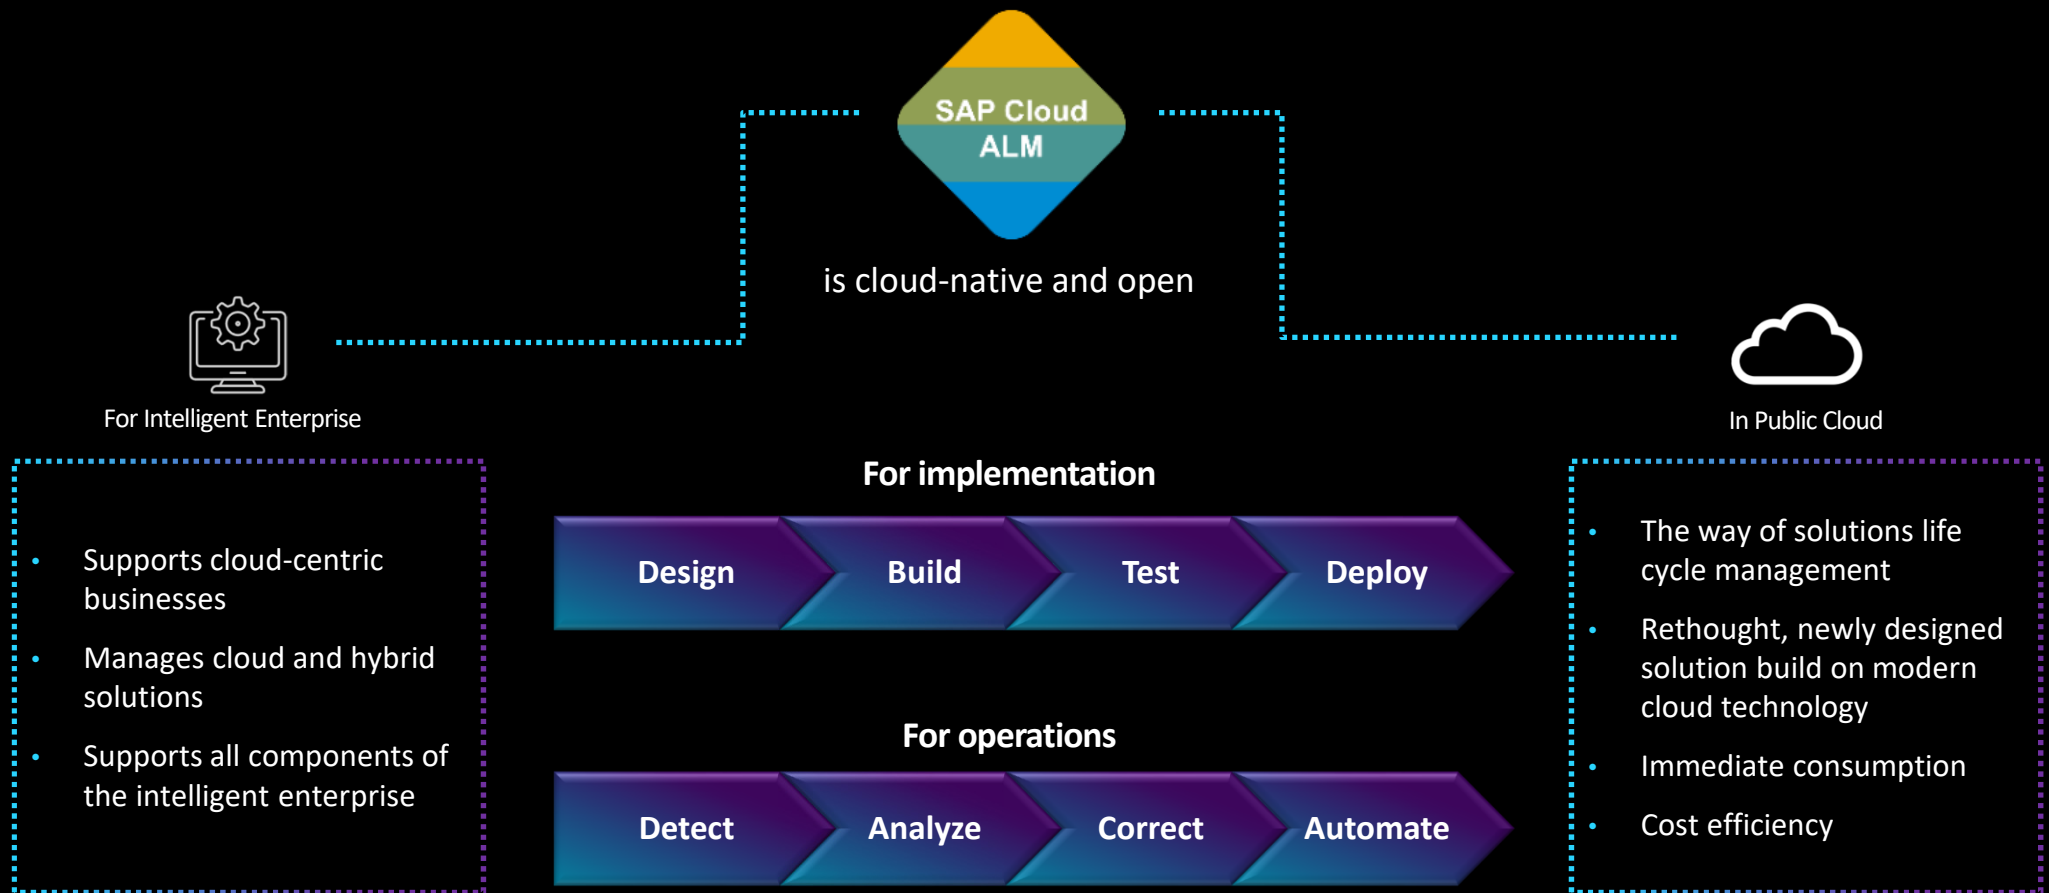

## Extension Suite

- Simplified application development without disrupting core applications
- Access to APIs and events of SAP solutions such as Ariba, S/4HANA Cloud Edition, Success Factors
- Enterprise-grade framework and ready-to-use business services
- Low-code and multichannel experience development
- ➔ allows the adoption of agile development approaches, making it easier to manage the entire application lifecycle from development to deployment.

## Integration Suite: SAP iPaaS

- Comprehensive suite of capabilities to meet evolving integration needs
- An API-first approach to building software across cloud and on-premise environments
- Prepackaged, managed integration flows, business events, and APIs
- Broad catalog of third-party integration packs and APIs
- Intuitive Web tooling and artificial intelligence–driven integration
- Enterprise-class governance, security, and scalability

## SAP Continuous Integration and Delivery

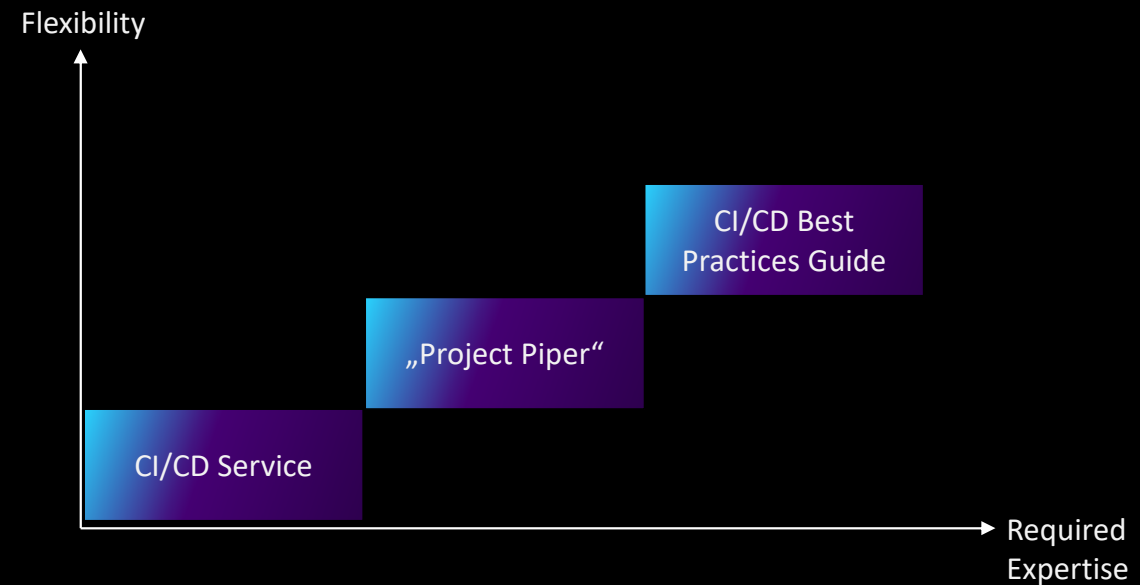

- A service on SAP BTP
- Allows configuration and running of predefined continuous integration and delivery pipelines that test, build, and deploy code changes.
- Supports the development of SAP Cloud Application Programming Model (CAP) and SAPUI5/SAP Fiori applications.

## „Project Piper“

- Open-source project
- provides preconfigured Jenkins pipelines: usable across own Jenkins infrastructure.
- It consists of two components:
  - Shared Library: description of steps, scenarios, and utilities required to use Jenkins pipelines
  - A set of Docker Images: can be used to implement best practice processes

## Continuous Integration and Delivery Best Practices Guide

- Best practice procedures to implement continuous delivery pipelines on any CI/CD stack
- Application of CI/CD principles to SAP-specific technologies.

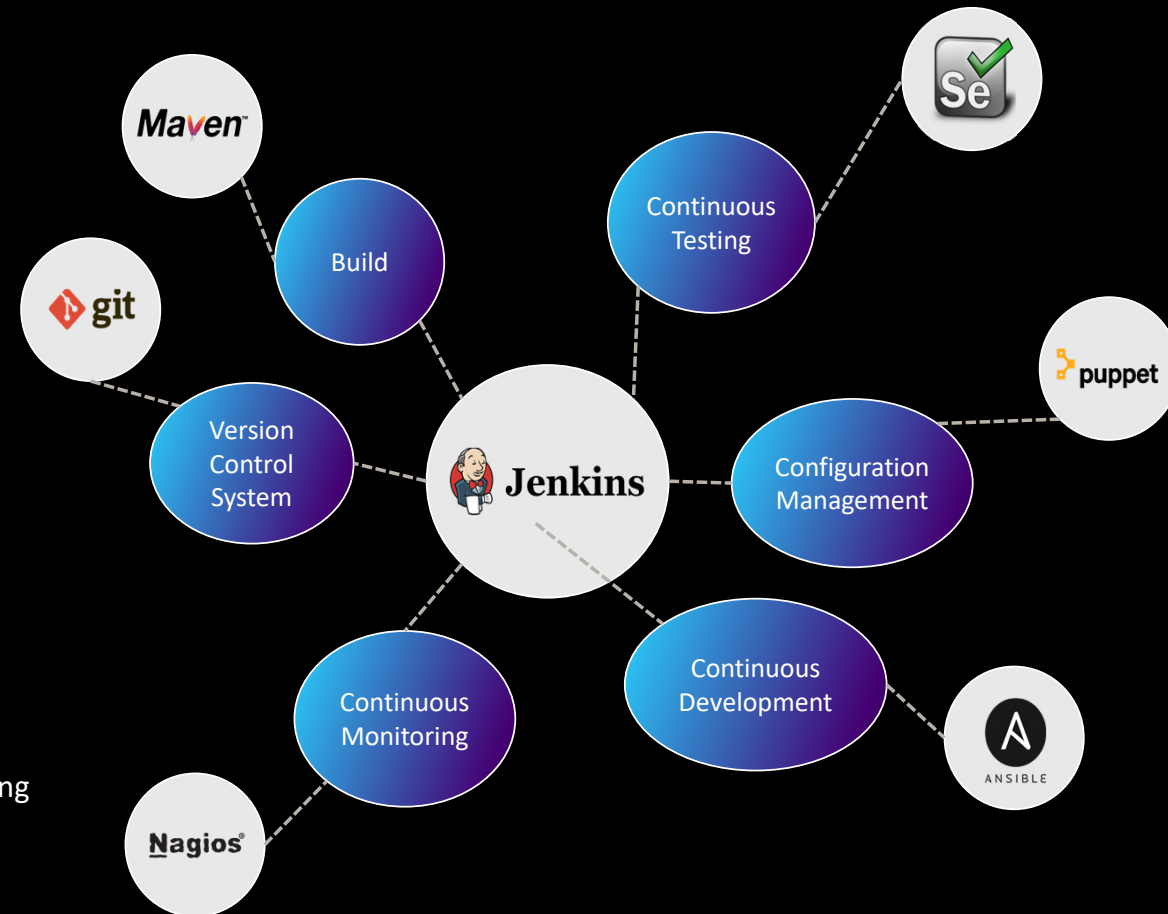

# „Project Piper“

## Plugin for CI/CD for ABAP.

Applicable to projects both for SAP BTP and SAP on-premise platforms

Available Artifacts:

- A set of ready-made Continuous Delivery pipelines for direct use
- **ABAP Environment Pipeline**
- **General Purpose Pipeline : merged with SAP Cloud SDK Pipeline**
- A shared library: contains reusable step implementations
  - ➔ Enables customization of preconfigured pipelines
  - ➔ build own customized pipelines
- A standalone command line utility for Linux and a GitHub Action
- A set of Docker images to setup a CI/CD environment in minutes using sophisticated life-cycle management

The Best Practice way → Ready-made pipelines

The do-it-yourself way → Build with Library - shared library contains building blocks

# „Project Piper“ for ABAP Development

## ABAP Environment Pipeline

Goal: enable Continuous Integration for the SAP BTP, ABAP environment (also known as Steampunk)

The pipeline contains several stages and supports different scenarios. → user can choose a subset of these stages, which fits their use case

### Scenarios:

#### 1. Continuous Testing :

- The development is done within repositories and "transported" via git-based approaches
- Three relevant stages: "Prepare System", "Clone Repositories" and "ATC"

#### 2. Building ABAP Add-ons for Steampunk

- Intended for customers who want to provide a Software as a Service (SaaS) solution on the SAP BTP using the ABAP Environment.
- Different steps responsible for a single task. The steps themselves are grouped semantically into different stages

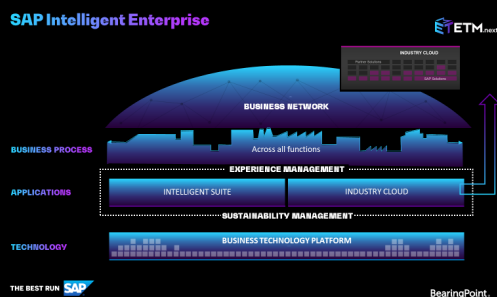

# **Sneak Peak of an Application from our Digital Solution Factory**

# ETM.next as part of the SAP EC&O industry cloud offering

Supporting end-to-end processes in an intelligent and modular fashion while embedded into the overall value chain

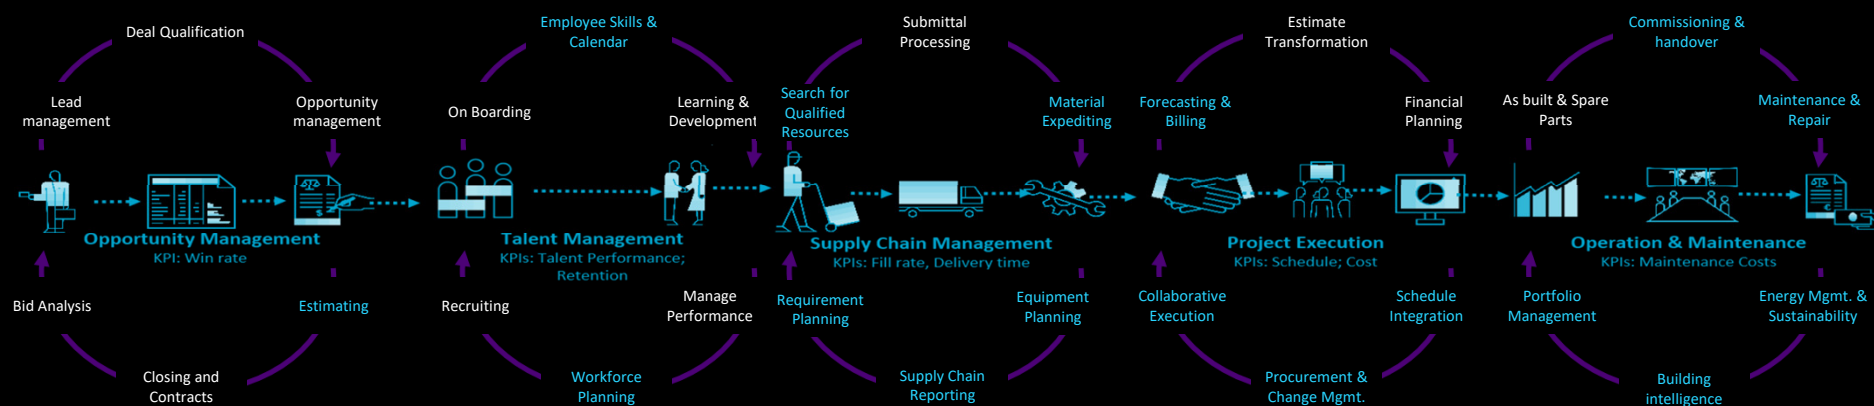

Integral part of industry cloud offering for EC&O

Award Winning

Available on SAP Store

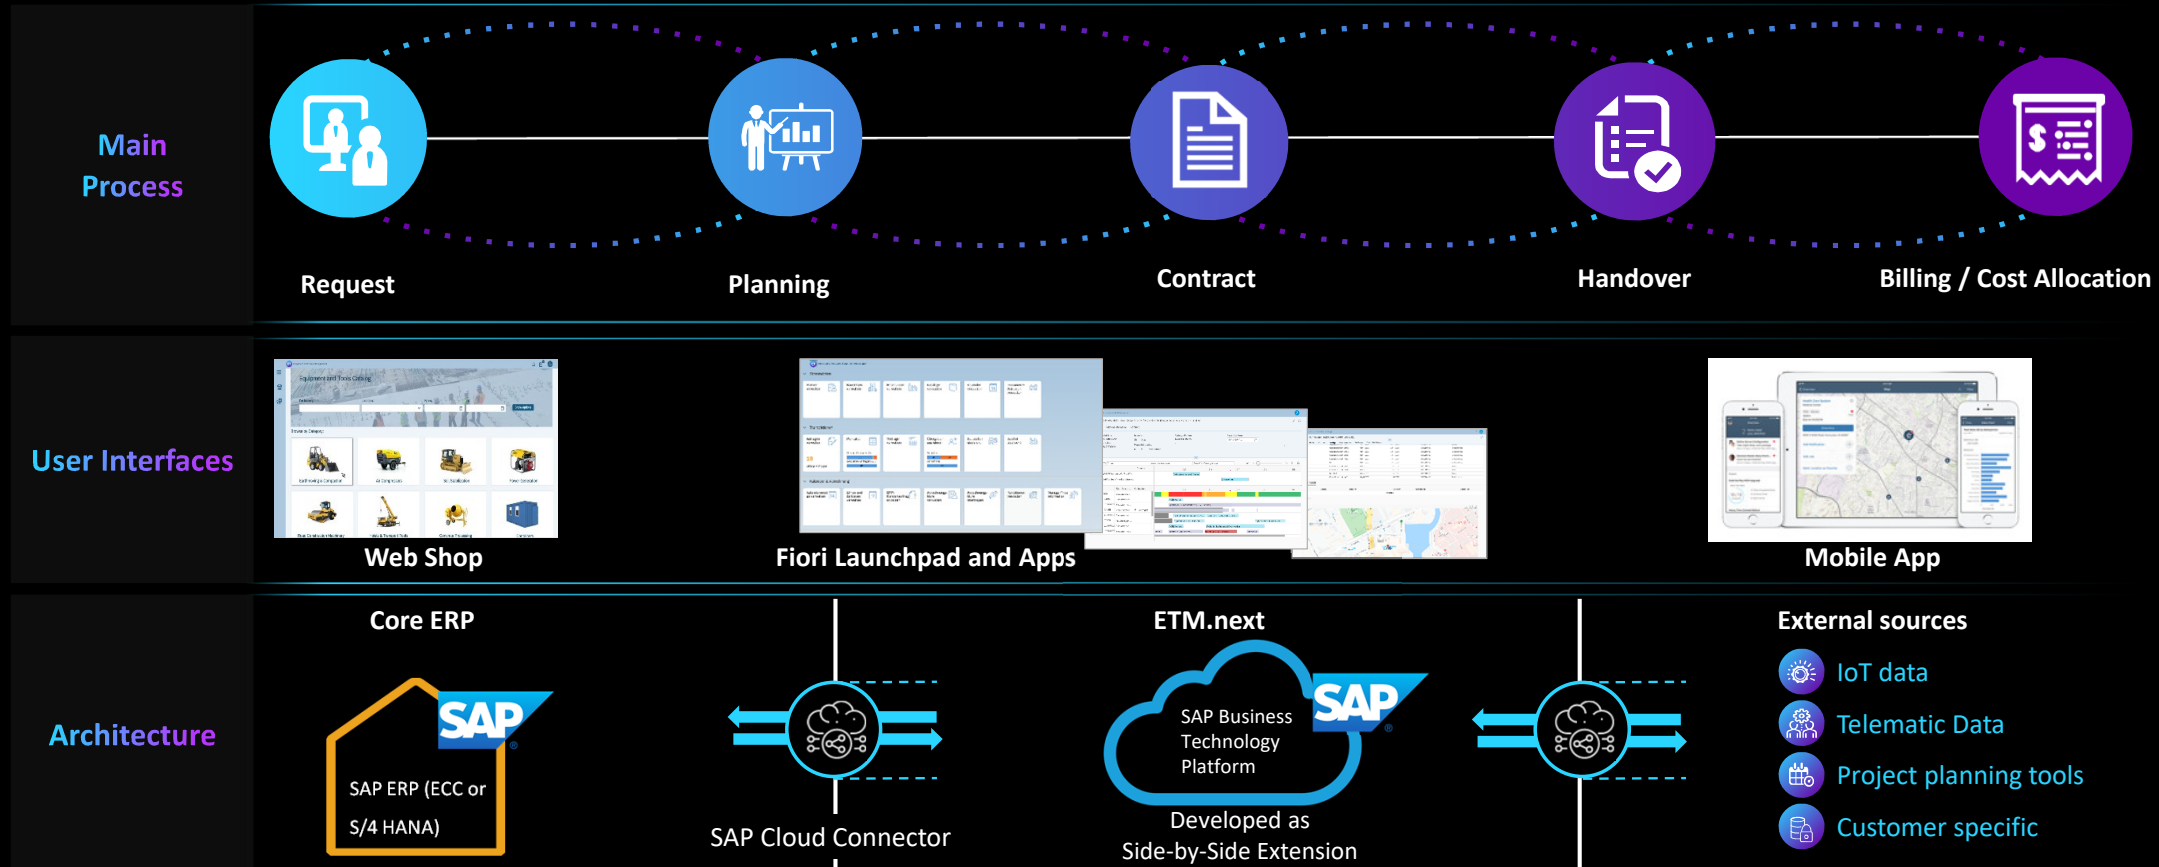

Colored Processes are supported by

Functionalities

BearingPoint®

# High Level Process, User Interfaces & Architecture Overview

# Major benefits of ETM.next – What's in ?

## Finance & Controlling

### Digitization & IT

- Cost Reduction by:

Increased Utilization	Process Digitalization	Process Efficiency	Less idle-times & losses
-----------------------	------------------------	--------------------	--------------------------

- Process improvements by:

Billing Simulations	Reporting & Analytics	Deep ERP integration	Intra- & Intercompany
---------------------	-----------------------	----------------------	-----------------------

- Digitization by:

Mobile App	Asset Identification (Scanning)	Photo Documentation
Electronic Signature	Telematic Integration (PORR Black Boxes)	Asset Track & Trace

- Future-proven for IT:

Industry Cloud Application	Side-by-side extension to ERP	Long-term commitment
----------------------------	-------------------------------	----------------------

## Business & Operations:

### Equipment-as-a-Service

- Fleet Management:

IoT & Telematics	Stock Overview	ERP Integration	KPI Controlling
------------------	----------------	-----------------	-----------------

- Yard Management

Inspections, Safety & Compliance	Warehouse Management	Multiple Storage Locations
----------------------------------	----------------------	----------------------------

- Site Management:

Cost Transparency	Local Warehousing	Theft Protection
-------------------	-------------------	------------------

- Planning & Disposition:

Improved Planning Board	Accuracy on Availability	Reservation Process
-------------------------	--------------------------	---------------------

- Project Management & Commercial:

Contract with all data	Revenue Transparency	Billing Simulations	Procurement Support
------------------------	----------------------	---------------------	---------------------

# **Lessons Learned while establishing our Digital Solution Factory and Developing for BTP**

## Our lessons learned from setting up our own Digital Solution Factory

- Invest in actively into training your teams
  - Build a Community of Communities and foster communication and knowledge transfer
- Standardize Workplaces (standard tools, standard processes, standard reporting)
  - Reduce Support and Ramp-up, Ramp-down efforts, as well as flexibility on task assignment
- Chose the right toolset for the purpose (i.e.: web ide vs. BAS vs. VSCode) and review frequently
  - Web IDE fullstack ist the only one supporting graphical calculation views  
VSCode is very famous with the Open-Source community
  - Use the CAP framework
- Centralize
  - Toolset, Repository, Standards & Guidelines
  - Landscape Operations
  - Cloud Provisioning
